Academic Performance and Work Placements: Does Academic Performance influence the Decision to Complete a Work Placement?

Abstract

Purpose: There is strong evidence that year-long work placements make students more employable and produces better academic performance. Despite this, UK participation rates remain stubbornly low. We examine the influence of academic performance on students' willingness and ability to complete work placements.

Originality: Our research adds to the literature investigating the influence of academic performance through academic self-concept on students' investment decisions to include a work placement in their degree study and in students' ability to secure a work placement.

Design: Our novel conceptual framework distinguishes students by their intentions regarding work placements indicated at enrolment as well as whether they completed a work placement. We use a sample of 226 business and economics students, employing propensity score weighted multiple regression to analyse the influence of academic performance.

Findings: Our results indicate that academic performance has a significant influence on the decision to include a work placement option at enrolment. For those students who do pursue work placements, first-year academic performance had a significantly positive impact on their ability to secure a placement job. Finally, completion of a work placement was beneficial to final year academic performance.

Practical implications: Work placements are beneficial. Since low academic performance deters students from pursuing such opportunities, universities may need to communicate the benefits better to encourage greater interest. Further, universities need to realistically manage the expectations of students with low academic performance who want to do work placements and provide targeted

1
2
3 support during the application process. Furthermore, alternatives to work placements should be
4
5 provided.

20 **Introduction**

21 Year-long work placements have long been a part of degree courses in UK Higher Education.
22
23 Traditionally, such placements were a compulsory feature of vocational courses in Business, Health
24 and the Sciences, providing students with an opportunity to apply their knowledge from academic
25 study and develop skills, qualities and attributes which would be beneficial in future employment.
26
27 With renewed interest in the employability of university graduates following the Wilson Review
28 (2012), the range of courses offering such placements broadened from vocational courses to
29 traditionally non-vocational disciplines such as History, English and Economics. Data published by
30 the Higher Education Statistical Agency (HESA) show that the percentage enrolling on sandwich
31 courses, typically a four-year course where a student spends the penultimate year on a work
32 placement, rose by 26% between 2014/15 and 2018/19 (HESA, 2020). However, despite this
33 expansion in the number of students enrolling on sandwich courses, the percentage completing a
34 year-long work placement has not risen. Indeed, in the latest available data on graduate outcomes,
35 the percentage of students completing placements fell to 7.3% in 2018/19 compared to 8.5% in
36 2014/15 (GOV.UK, 2019). Internationally, this participation rate compares unfavourably with many
37 European countries (Arthur and Little, 2010).

44
45
46
47
48
49
50
51
52
53
54

55
56 Both the employment and academic benefits of completing work placements are well-established in
57 the literature. Research on employment outcomes demonstrate that the completion of work
58
59
60

1
2
3 placements fosters career-related competencies which produces higher levels of employability
4
5 (Brooks and Youngson, 2016). Work on academic outcomes highlight that many of these
6
7 competencies acquired by students during work placements can be valuable during academic study
8
9 in the final year (Auburn, 2007). Studies across a range of disciplines have shown evidence of
10
11 superior academic performance among students who have completed work placements (see Duignan,
12
13 2002 and Green, 2011 for business students; Gomez, Lushman and Clements, 2004 for bioscience
14
15 students; Mandilaras, 2004 for economics students; Mansfield, 2011 for surveying students; Surridge,
16
17 2009 and Crawford and Wang, 2016 for accounting and finance students).

18
19
20
21
22 There has been limited research investigating differences between those who complete work
23
24 placements and those who do not. The studies which have been done focus on academic ability, using
25
26 a range of measures of performance including university entry qualifications, first-year and second-
27
28 year marks as proxies. In general, they find that students with higher academic performance are more
29
30 likely to complete work placements (Brookes and Youngson, 2016; Naughton and Naughton, 2016;
31
32 Jones et al., 2017).

33
34
35
36
37 On most degree courses, work placements tend to be a voluntary opportunity for students. Enrolment
38
39 data suggests that there is still a significant percentage of students who do not enrol on sandwich
40
41 degrees and have no intention of completing a work placement. To our knowledge, no research has
42
43 been done regarding the decision to enrol on a sandwich study route – a route with a work placement.
44
45 Therefore, drawing on Calsyn & Kenny (1977) and Brynin (2012), we add to knowledge by analysing
46
47 the influence of prior academic performance through academic self-concept in the investment
48
49 decision made at enrolment to spend an additional year pursuing a work placement option.

50
51
52
53 Further, the discrepancy in the percentage who enrol on sandwich degrees and the percentage who
54
55 go on to complete work placements suggests that many who intend to complete a work placement do
56
57 not. Little is known about their characteristics. Differentiating students by their preferences indicated
58
59
60

1
2
3 at enrolment as well as whether they completed a work placement enables our work to separate this
4
5 group from their peers who successfully secure and complete year-long work placements.
6
7
8 Consequently, our work can analyse the influence of academic performance on the competitive
9
10 application process.
11
12

13 The paper addresses the following research questions:
14
15

- 16 a) Does academic performance influence the decision to apply for work placements?
- 17
- 18 b) Does academic performance influence a student's ability to secure a work placement?
- 19
- 20
- 21 c) Does completion of a work placement enhance final year academic performance?
- 22

23 To address these research questions, we analyse the preferences of a sample of business and
24
25 economics students indicated at enrolment at a UK University.
26
27

28 Our results indicate that students who indicated a preference for work placements at enrolment
29
30 demonstrated higher prior academic performance than students who did not. This suggests that
31
32 academic performance is a significant influence on the investment decision to include a work
33
34 placement in a programme of study. Further, students who indicated they wanted to do a work
35
36 placement but did not secure one demonstrated significantly lower first year grades than their peers
37
38 who completed work placements. This suggests that academic performance at that point influences
39
40 the competitive application process involved in work placements. Finally, our results indicate that
41
42 completion of a work placement has a significantly positive impact on final year performance.
43
44
45

46 Our findings have implications for the design of and support for work placement opportunities in
47
48 universities in the UK to increase participation. The results support policies for including work
49
50 placements opportunities in all degree programmes. However, a significant proportion of students
51
52 indicated no intention of completing work placements at enrolment. Low academic performance is
53
54 evident as an important criterion in that decision, and this suggests that these students may have low
55
56 confidence in their ability to secure a work placement. Universities should do more to encourage and
57
58
59
60

1
2
3 support these students in pursuing work placement options. In addition, since first-year academic
4 performance is an important factor in determining whether a placement is secured, its importance
5 needs to be emphasised in messaging around work placements. Finally, there will still be a significant
6 body of students who will be unable to complete work placements so, universities need to provide
7 alternative ways for students to develop the skills, qualities and attributes normally gained during
8 work placements to enhance their employment and academic outcomes.
9

10
11 The paper proceeds as follows. The next section reviews the literature and explains the research
12 hypotheses. The following section describes the research design and methods used in the study.
13

14
15 That is followed by the presentation of results. Then, the results are discussed. The final section is
16 the conclusion, including suggestions for further research.

22 23 24 25 26 27 28 29 30 **Literature Review and Hypotheses**

31
32 Year-long work placements provide students with an opportunity to apply their knowledge from
33 academic study and develop skills, qualities and attributes which will be beneficial in future
34 employment. Therefore, one strand of research focuses on identifying whether the experience
35 produces beneficial employment outcomes for students, while a second strand examines whether
36 work placements have academic benefits in the final year.
37
38
39
40
41
42

43 44 *Employment benefits of Completing a Work Placement*

45
46
47 The completion of work placements should develop career-related skills, qualities and attributes
48 which lead to better employment outcomes after graduation. Bridges (1993) highlights transferable
49 or generic skills such as self-management, communication and problem-solving that can be enhanced
50 in a work-based setting. Neill and Mulholland (2003) propose the work-based development of skills
51 which enhances the commercial awareness of placement students. Bourner and Ellerker (1998) agree,
52 suggesting that the effect of workplace learning can be further enhanced when integrated into studies.
53
54
55
56
57
58
59
60

1
2
3 Research shows that placement students are at a distinct advantage over non-placement students when
4
5 applying for jobs after university. They have a substantial body of experience to draw upon and are
6
7 better positioned to articulate their skills and abilities in relation to job roles (Raybould and Sheedy,
8
9 2005). Further, since graduate recruitment processes utilise similar techniques to the ones used to
10
11 recruit students for a work placement, the successful experience of securing a placement give students
12
13 more confidence when applying for graduate positions (Branine, 2008; Purdie et al., 2011).
14
15
16

17
18 The development of transferrable skills in the workplace and the confidence placement students gain
19
20 from the experience improves their employment outcomes upon graduation. Students who have
21
22 completed a year-long work placement are more likely to be in graduate employment within six
23
24 months of completing their studies (Mason, Williams, and Cranmer, 2009). Brooks and Youngson
25
26 (2016) find that placement students' employment outcomes are better as they are more likely to work
27
28 full-time in an appropriate level graduate role, with a higher starting salary compared to non-
29
30 placement students.
31
32
33

34 *Academic Benefits of Completing a Work placement*

35
36

37
38 In addition to positive employment outcomes for placement students Auburn (2007) highlights a
39
40 range of knowledge, skills and attributes acquired during work placements which can be valuable to
41
42 students during academic study in their final year, improving their performance. These include better
43
44 personal and intellectual development, greater confidence and motivation. Anecdotal observations of
45
46 the behaviour of students who had completed work placements support this (Little and Harvey, 2007).
47
48

49
50 Across a range of subject areas, research has investigated the relationship between completion of
51
52 work placements and academic performance in the final year. An early study by Duignan (2002)
53
54 conducted a statistical analysis of the examination results of a sample of business undergraduates
55
56 across two cohorts finding a significant difference in the final year academic performance of
57
58
59
60

1
2
3 placement students and non-placement students. The study is limited by its failure to control for
4
5 academic ability and other characteristics such as socio-economic background.
6
7

8
9 Other literature which control for such factors, suggest that completion of a work placement enhances
10
11 academic performance. Gomez, Lushman and Clements (2004) used multivariate regression analysis
12
13 to study the impact of work placements on the academic performance of biosciences students
14
15 reporting that placement students exhibited improved final year academic performance. Similarly,
16
17 Surridge (2009) using regression analysis for three cohorts of accounting and finance students found
18
19 that placement students perform significantly better in the final year. In an analysis of economics
20
21 students, Mandilaras (2004) found that those who completed a placement year had a significantly
22
23 higher probability of obtaining an upper-second class degree. Mansfield (2011) using analysis of
24
25 covariance for five cohorts on a surveying degree found a statistically significant improvement in
26
27 final year marks for students who completed a sandwich degree incorporating a placement. Analysing
28
29 one cohort of business students, Green (2011) found significantly higher mean marks for placement
30
31 students compared to those who do not go on placement. Crawford and Wang (2016) found that work
32
33 placements improved the performance of both UK and international students on an accounting and
34
35 finance degree. Interestingly, it is the former group which derive the greatest benefit. Brooks and
36
37 Youngson (2016) conduct an analysis across six subject areas - creative arts and design, business,
38
39 mathematics and computer sciences, engineering, physical sciences and biological sciences. They
40
41 found that students who complete a work placement tend to see an increase in their final year grade
42
43 relative to the 2nd year. Non-placement students who continued straight into the final year do not.
44
45
46
47
48
49 Jones et al., (2017) analyse a large sample of students across subject disciplines at Aston University
50
51 and business at the University of Ulster. They find that the effect of undertaking a sandwich work
52
53 placement on final year academic performance was positive and significant. In their sample, business
54
55 and engineering students reaped the greatest benefits in terms of improved final year performance.
56
57
58
59 They propose that work placements that are aligned to academic disciplines are more likely to
60

1
2
3 produce superior performance, suggesting an ability to apply theory to practice adds to the
4 experiential skills developed. Therefore, studies suggest that across a range of disciplines,
5 participation in a work placement improves academic performance in the final year.
6
7
8
9

10 11 12 13 14 *Prior Academic Performance and the completion of Work Placements*

15
16 The evidence above suggests that work placements create a gap in both employment outcomes and
17 academic achievement between placement and non-placement students. In addition, studies which
18 have investigated the impact of work placements on final-year academic performance find that
19 students who complete work placements have higher prior academical performance. Mansfield
20 (2011) plus Naughton and Naughton (2016) used solely second year marks to measure academic
21 performance. Brooks and Youngson (2016) used first and second-year grades. SurrIDGE (2009), Green
22 (2011) plus Crawford and Wang (2016) all used entry qualifications and first-year or second-year
23 scores. Mansfield (2011), SurrIDGE (2009) and Green (2011) did not find that that previous academic
24 performance was significant in explaining the observed differences in final year performance between
25 placement and non-placement students. In contrast, Crawford and Wang (2016), Brooks and
26 Youngson (2016) plus Naughton and Naughton (2016) found that placement students had higher
27 academic performance compared to their non-placement counterparts prior to the placement year.
28 Jones et al., (2017) highlight endogeneity problems with the methodology used by the above literature
29 which can result in biased estimates. Instead, they use propensity score matching to avoid the need
30 to construct valid instruments. Students are matched for characteristics and differentiated solely on
31 whether they went on placement or not. Their results show that students with better academic
32 performance are more likely to complete work placements. In summary, these results suggest that a
33 gap in academic performance between placement and non-placement students already exists and that
34 this gap is widened by the experience of the work placement.

54
55
56
57
58
59
60

1
2
3 Given the proposed benefits, it is surprising that participation has not increased as the percentage of
4 students enrolled on sandwich degrees has risen. There has been little investigation of this. This paper
5 contributes to the literature by addressing two aspects of participation. Firstly, we investigate the
6 impact of prior academic performance on the decision to include a work placement in a programme
7 of study. Secondly, we investigate whether academic performance influences whether a student
8 secures a placement role.
9

10
11 Since a significant proportion of students enrol on full-time degrees many students do not even
12 consider completing a year-long work placement. However, little work has analysed the reasons for
13 this. Given the evidence that students with better academic performance tend to secure work
14 placement jobs, we propose that prior academic performance may influence the decision to enrol on
15 a sandwich route (with a work placement) or full-time route (without a work placement).
16
17

18
19 Prior academic performance can influence the decision through the theory of academic self-concept.
20 These are self-perceptions about one's ability formed through experience with and interpretation of
21 the surrounding environment (Shavelson et al., 1976). From the skills development model, academic
22 self-concept emerges from academic performance (Calsyn and Kenny, 1977). Better academic
23 performance enhances academic self-concept enhancing students' sense of worthiness and
24 competence and making them feel more confident (Marsh and Martin, 2011). For instance,
25 Mohammad (2010) found that pre-university students who get higher grades developed higher levels
26 of confidence.
27
28

29
30 We propose that it is the influence of academic performance on confidence which influences the
31 decision to pursue work placement opportunities. Brynin (2012) highlighted that university study is
32 an investment decision and suggests that completing a placement raises the amount of investment
33 through additional fees, living costs and the opportunity costs of delaying employment. Further, there
34 are time and effort involved in applying for placement jobs. Given the evidence that students with
35
36
37
38
39
40
41
42
43
44
45
46
47
48

50
51
52
53
54
55
56
57
58
59
60

1
2
3 worse academic performance are less likely to secure placements, low academic self-conception may
4 make such students less confident in their ability to do so. Therefore, they may consider the
5 investment in time and effort applying to be a waste and be more likely to enrol on full-time routes
6 instead. We add to previous work by relating academic performance to the investment decision to
7 pursue work placement opportunities through its influence on students' academic self-concept. Our
8 first hypothesis derives from this:
9
10
11
12
13
14
15
16
17

18 Hypothesis 1: Students with higher academic performance are more likely to choose to complete
19 work placements.
20

21
22 In most degrees, completion of a work placement is not guaranteed. It is an optional feature of degrees
23 where students compete for a position through an application process. Little is known about the
24 academic performance of students who enrol on a sandwich route of study, apply for placement
25 positions but fail to secure one. Graduate outcomes surveys indicate that these represent a substantial
26 percentage of the student body. In previous analysis, these students are included in the group which
27 do not complete work placements. Yet, as Jones et al., (2017) acknowledge, such students may have
28 higher academic performance who lose out in the competitive process in applying for placement jobs.
29 The influence can work in several ways. Firstly, employers may use measures of academic
30 performance as a way of distinguishing candidates in the application process. Secondly, students with
31 higher academic self-concept may be more confident in their abilities and perform better in certain
32 stages of an application process such as assessment centres and final interview. We aim to address
33 this gap by testing the influence of prior academic performance in the competitive application process
34 for work placement opportunities. Therefore, we test this using the following hypothesis:
35
36
37
38
39
40
41
42
43
44
45
46
47
48
49
50
51

52 Hypothesis 2: Students with higher academic performance are more likely to successfully secure
53 work placements.
54
55

56 Finally, we test whether the completion of a work placement has a significant impact on final year
57 performance with the following hypothesis:
58
59
60

1
2
3 Hypothesis 3: Completion of a work placement has a positive influence on final year academic
4 performance.
5
6
7
8
9

10 **Research Design**

11 *Data and Sample*

12 We sourced data routinely collected at enrolment and for measuring progression and performance
13 for one full cohort of students from two undergraduate degree courses (economics and business) at
14 a UK university. We gained ethical approval from the University for the use of this data for the
15 purpose of the research project. In doing the work, we complied with the Institution's ethical policy.
16
17 After student data were sourced from University databases and checked for any errors or omissions,
18 the data were anonymised on a spreadsheet for the process of analysis. Once the anonymised
19 spreadsheet was created, the source files were deleted.
20
21
22
23
24
25
26
27
28
29

30 At the University work placements are an optional feature of business and economics degrees.
31 However, when enrolling students choose either a sandwich (with a work placement) or full-time
32 (no work placement) study route. Therefore, they signal an intention to complete a work placement
33 at that time. However, during their degree students can transfer to the alternative route. Some
34 students may intend to complete a work placement but do not. Consequently, they transfer to the
35 full-time route. Others who started on the full-time route can transfer to the sandwich route if they
36 pursue and secure a work placement.
37
38
39
40
41
42
43
44
45
46

47 The record of these intentions enables our work to distinguish the impact of academic performance
48 on the decision to complete a work placement at enrolment and the impact of academic performance
49 on the competitive application process. We distinguish different groups of students based on (i) the
50 route selected on entry – sandwich (placement) or full time (no placement) - and (ii) the actual route
51 – dependent on whether a student completed a work placement. The paths of the different groups of
52 students and the related hypotheses are outlined in figure 1.
53
54
55
56
57
58
59
60

1
2
3 Insert figure 1 here
4
5

6 On entry the students who indicated they did not want to do a work placement are denoted FT, and
7
8 the students who indicated that they intended to do a work placement are denoted SW. Analysing
9
10 differences in the academic performance evident at enrolment between those who enrol on the full-
11
12 time route and those who enrol of the sandwich route enables the research to assess its influence on
13
14 the decision to apply for work placements and test hypothesis 1. If hypothesis 1 is correct, the SW
15
16 group should have significantly superior prior academic performance than the FT group.
17
18

19
20 Thereafter, we distinguish three separate groups:
21
22

- 23 1. Students who indicated they did not want to do a work placement and did not (denoted as FT-FT
24
25 in our analysis).
26
27
- 28 2. Students who indicated they wanted to do a work placement but did not secure one (denoted SW-
29
30 FT).
31
32
- 33 3. Students who indicated they wanted to do a work placement and completed one (SW-SW).
34

35 Analysing differences in the academic performance between the SW-FT group and the SW-SW group
36
37 enables the research to assess its influence on the competitive process involved in applying for
38
39 placement positions and test hypothesis 2. If there is evidence to support hypothesis 2, the SW-SW
40
41 group should have significantly higher academic performance than the SW-FT group. Analysing
42
43 differences in final-year academic performance between the three groups enables the research to test
44
45 hypothesis 3. The completion of a work placement should have a significant impact on final year
46
47 academic performance. The SW-SW group should exhibit significantly higher academic performance
48
49 compared to both the SW-FT and FT-FT groups.
50
51

52
53
54 A very small number of students initially on the full-time route secured a year-long work placement
55
56 and transferred from the full time to sandwich route. However, the small number means that it is
57
58
59
60

1
2
3 impossible to make meaningful comparisons so the data from these students are not included in
4
5 analyses reported here.
6
7

8 *Measures of academic performance and independent variables*

9

10
11 In our analysis we use several measures of academic performance. For hypothesis 1, we measure
12
13 academic performance evident at enrolment using the UCAS points (UCAS, 2022) gained by a
14
15 student. For hypothesis 2, we measure academic performance prior to the completion of a work
16
17 placement using average marks attained in the first year (recorded on a percentage scale from 0 to
18
19 100). Specifically, the mean score of all summative assessments (i.e., a mix of coursework and exam
20
21 grades) taken by each student during their first year. To measure academic performance after the
22
23 completion of work placements we use average marks attained in the final year (recorded through a
24
25 percentage scale from 0 to 100). That is, the mean score of all summative assessments (i.e., a mix
26
27 of coursework and exam grades) taken by each student during their final year. In the regression
28
29 model to test hypothesis 3, first year marks and second year marks are included as controls reflecting
30
31 prior academic performance. This is consistent with the existing literature (SurrIDGE; 2009; Green,
32
33 2011; Crawford and Wang; 2016).
34
35
36
37
38

39 We also distinguish students using other characteristics which have been identified as important
40
41 explanations of differences in academic ability between students. The following variables were all
42
43 obtained from routinely collected application and enrolment data. For Age, we used a binary
44
45 variable denoted as 0 for students aged 18-20 at enrolment and 1 for those aged above that. For
46
47 Gender, we used a binary variable denoted as 0 for male and 1 for female indicated at enrolment.
48
49 For Ethnicity, we used a binary variable denoted as 0 for students with a white ethnicity and 1 for
50
51 students recorded as ethnic minority groups. For residency, we used a binary variable denoted as 0
52
53 for UK students and 1 otherwise. We distinguish entry qualifications using a binary variable with 0
54
55 denoting students with A-level entry qualifications and 1 denoting alternative or mixed entry
56
57
58
59
60

1
2
3 qualifications (combination of A-levels and alternatives). Intention to undertake a placement or not
4 was indicated by each student on application to the course i.e., application to the Sandwich or Full-
5 time route. Finally, we use a binary variable to indicate whether a student is deemed part of a
6 disadvantaged group underrepresented in higher education. Some of the main indicators include
7 Participation of Local Area (POLAR) indices of Multiple Deprivation (IMD), ACORN
8 demographics and household income data (Gorard et al., 2019).

20 *Methods of Analysis*

21
22
23 Multiple regression analysis was used to assess the three hypotheses. A propensity scoring
24 methodology was adopted to overcome the problem of selection bias. This is beneficial for our small
25 sample since it allowed all the student observations to be included in the regression analysis. The
26 Toolkit for Weighting and Analysis of Non-equivalent Groups (TWANG) Shiny application (for two
27 groups see Griffin et al., 2020 and for three groups see Stelzner et al., 2020) was used to estimate
28 propensity score weights (PSWs) for the observational data in the different treatment groups as shown
29 in Figure 1. The propensity score weights were assessed to determine if the weighting then balances
30 the distributions of covariates between the treatment groups being compared. The absolute effect size
31 (ES) differences (also called the absolute standardized mean difference or standardized bias [SB])
32 and the Kolmogorov-Smirnov (KS) statistic were used to assess balancing (details given in
33 MaCaffrey et al., 2013). The propensity scores are used as weights in linear regression models to
34 balance the influence of the different groups of students. To assess the success of the propensity
35 scores as weights for removing selection bias, appropriate diagnostic tests were employed (see
36 MaCaffrey et al., 2013).
37
38
39

42
43
44
45
46
47
48
49
50
51
52
53
54
55

56 Propensity score weights were calculated using the TWANG packages. Descriptive statistics and
57 treatment effect estimates using weighted multiple linear regression were calculated using the Minitab
58
59
60

software package (Minitab 19 Statistical Software, 2020). The data from students on the two courses (Business and Economics) were analysed separately and pooled. The findings were similar for each course when analysed separately and so the pooled analyses are presented here.

In testing hypothesis 1, the average treatment effect (ATE) is the comparison of UCAS points had the entire population been observed as the SW group versus had the entire population been observed as the FT group.

In testing hypothesis 2, the average treatment effect (ATE) is the comparison of first year had the population of students who enrolled on the sandwich route been observed as the SW-SW group versus had they been observed as the FT-SW group.

In testing hypothesis 3, the average treatment effect (ATE) is the comparison of final year mark had the entire population of students been observed as the SW-SW group versus had they been observed as the FT-SW group or FT-FT group.

Results

This section presents the summary descriptive statistics of the variables, and the propensity score adjusted linear multiple regression analyses to test the stated hypotheses.

Descriptive statistics

Table 1 shows the descriptive statistics for the academic performance of the sample of students and the control variables. The demographic variables reflect the typical characteristics of business-school students at UK universities (Education Policy Institute, 2020); a large majority of young, white, male students with home residency. Thirteen percentage were classified as having widening participation status. A large minority (29%) had studied a variety of pre-entry qualifications such as BTEC or A-level/BTEC mix. Only 3% of the students had commenced their course as 'mature' students. Table 1

1
2
3 also shows that mean mark for all students increased over the 3 years of academic study. This is
4
5 consistent with previous studies (e.g., Jones et al., 2017).
6
7
8
9

10 Insert table 1 here
11
12
13
14

15 A total of nine students (3.8% of the total number available) had missing first year grades and were
16 omitted from the analyses. These students had joined their course at the University after having
17 studied the first year of a degree elsewhere. Analysis of these students' data showed that they reflected
18 the average characteristics of the main cohort, and so very minimal or no bias was expected by
19 excluding their data from the main analyses. Two other students commenced their studies on the full-
20 time route and completed on the sandwich route. These data are also excluded from the analyses.
21
22 This left a total of 226 students to be included in the empirical analysis.
23
24
25
26
27
28
29
30
31
32

33 Table 2 shows the routes taken by the students on their courses. It is of note that almost half of the
34 students that enrolled on their courses intending to include a work placement, did not complete one.
35 These students transferred to the full-time route (notation SW-FT). As the results illustrates, this is a
36 sizable proportion of those who enrolled on the sandwich route and justifies hypothesis 2.
37
38
39

48
49

50 *Multiple linear regression results* 51

52 a) Does academic performance influence the decision to apply for work placements?
53
54

55 Hypothesis 1: Students with higher academic performance are more likely to choose to complete
56 work placements.
57
58
59
60

1
2
3 The results of a propensity score weighted multiple linear regression analysis with UCAS points as
4 the dependent variable are presented in Table 3. UCAS points are not available for international
5 students and so these observations were excluded from the analysis (n=3 for SW and n=6 for FT).
6
7
8
9

10 Insert Table 3 here
11
12

13 The analysis shows that there is a significant difference in academic performance measured by UCAS
14 points between SW and FT students, on average 22.9 percentage points higher for the SW students.
15 Hence there is evidence to support hypotheses 1. Students with higher performance on entry were
16 more likely to select the SW route – with the work placement option. One of the additional covariates
17 is significant and suggests that on average, students with a mix of entry qualifications have
18 significantly higher UCAS points than students that completed only A levels (by 55.2 percentage
19 points).
20
21
22
23
24
25
26
27
28
29

30 Overall, the coefficient of determination (R^2_{adjusted}) is 17.1%. That is, the model and its linear
31 associations predicts 17.1% of the variation in UCAS points. None of the covariates in the regression
32 model were overly collinear. An analysis of the residuals showed a normal distribution and constant
33 variance and indicate the regression method is valid.
34
35
36
37
38
39

40 b) Does academic performance influence a student's ability to secure a work placement?
41
42

43 Hypothesis 2: Students with higher academic performance are more likely to successfully secure
44 work placements.
45
46

47 The results of a propensity score weighted multiple linear regression analysis with average first year
48 mark as the dependent variable is presented in Table 4. The treatment is the study route, coded zero
49 for students that start on the SW route but did not secure a placement (SW-FT) versus the students
50 that start on the SW route and did secure a placement (SW-SW),
51
52
53
54
55
56
57
58
59
60

1
2
3 Insert Table 4 here
4
5

6 The coefficients in the regression table are average treatment effects (ATE). That is, the comparison
7 of mean outcomes (first year mark) had the entire population been observed under treatment SW-
8 SW, versus had the entire population been observed under treatment SW-FT. The ATE of treatment
9 SW-SW relative to treatment SW-FT equals 2.85 percentage points, and this is significant at the 5 %
10 level. Thus, there is evidence to support hypothesis 2. Students with higher academic performance at
11 the end of the first year of university study are more likely to secure a placement position.
12
13
14
15
16
17
18
19

20 Overall, the coefficient of determination (R^2 adjusted) is 5.9%. That is, the model and its linear
21 associations predicts 5.9% of the variation in first year grade. None of the covariates in the regression
22 model were overly collinear. An analysis of the residuals showed a normal distribution but with some
23 non-constant variance and so partially meeting the assumptions of the regression method.
24
25
26
27
28
29

30 c) Does completion of a work placement enhance final year academic performance?
31
32

33 Hypothesis 3: Completion of a work placement has a positive influence on final year academic
34 performance.
35
36
37

38 The results of a propensity score weighted multiple linear regression analysis with average Final year
39 mark as the dependent variable are presented in Table 5. The ATE of treatment the SW-SW group
40 relative to treatment FT-FT equals 4.60 percentage points, and is the comparison of mean outcomes
41 (average final mark) had the entire population been observed under treatment SW-SW, versus had
42 the entire population been observed under treatment FT-FT. This is significant at the 1% level.
43
44
45
46
47
48
49
50

51
52
53 Insert Table 5 here
54
55
56
57
58
59
60

1
2
3 The ATE for SW-SW versus SW-FT is 3.38 percentage points. This difference is also significant.

4
5 The mean difference between SW-FT and FT-FT is 1.08, and not significant. Therefore, the results
6
7 indicate that placement (SW-SW) students on average attained significantly higher average marks
8
9 than the students that completed the FT-FT and the SW-FT routes of study. This supports hypothesis
10
11 3. Therefore, completion of a work placement has a significantly positive impact on final year
12
13 academic performance. Interestingly, the gender covariate is significant, indicating that female
14
15 students, on average, attained higher marks in the final year.
16
17
18
19

20 Overall, the coefficient of determination (R^2 adjusted) is 44.0%. That is, the model and its linear
21
22 associations predicts 44.0% of the variation in final year grade. None of the covariates in the
23
24 regression model were overly collinear (first and second-year marks were both significant predictors
25
26 in the model and were moderately collinear but did not significantly change the model if one or other
27
28 were removed). An analysis of the residuals showed a normal distribution and constant variance, and
29
30 so meet the assumptions of the regression method.
31
32
33
34
35
36
37

38 *Robustness checks of the propensity score weightings*

39

40 The absolute effect size differences and the Kolmogorov-Smirnov (KS) statistics were calculated for
41
42 all pairwise differences between the groups being compared. For brevity, instead of presenting all
43
44 the statistics for all pairwise differences analysed above we present the collapsed covariate summary.
45
46 This shows the maximum standardized effect size, maximum KS statistic and minimum KS p-value
47
48 for each covariate and is sufficient to assess overall balance. Table 6 presents the statistics before
49
50 weighting and Table 7 after weighting.
51
52
53

54
55 Insert table 6 here
56

57
58 Insert table 7 here
59
60

1
2
3 Before weighting, the covariates were very different across the groups for all variables to a greater
4 or less degree, indicating imbalance. Significant differences between groups indicated by the KS p-
5 value included First year grade, Ethnicity and Entry qualifications. After weighting, all KS values
6 were attenuated (values below 0.2, considered to be small and desirable; McCaffrey et al., 2013) and
7 there were no significant differences between the groups for any of the covariates. In summary, the
8 propensity score weightings achieved a good balance of the covariate values over the three treatment
9 groups.

10
11 The second check examines overlap of the distributions of the estimated propensity scores across the
12 treatment groups. Comparative boxplots (not shown) of the propensity scores by treatment group for
13 each one of the treatments, for each observation in the sample. The method produced generally very
14 good levels of overlap which is the desired property. Based on the quality checks it is concluded that
15 the groups are sufficiently similar to support causal estimation of the treatment estimates.

16 17 18 19 20 21 22 23 24 25 26 27 28 29 30 31 32 33 34 **Discussion**

35
36 Our results provide support for the hypothesis that students with better prior academic performance
37 are more likely to choose a work placement option as part of their degree. This is consistent with self-
38 concept theory and the findings of Mohammad (2010). This suggests that students with low academic
39 self-concept have less confidence that they will gain a work placement and think that the investment
40 in time and effort pursuing one will not be worth it. The significance of academic performance is
41 echoed in the results regarding the competitive application process for year-long work placement
42 opportunities. Students with higher first year grades were more likely to secure placement jobs. This
43 is consistent with the findings of several previous studies (cf. Brooks & Youngson, 2016; Jones et
44 al., 2017). While companies may use this information as part of screening involved in the selection
45 process, the results also support self-concept theory. The academic self-concept of those students
46 who have higher first year grades may be raised giving them greater confidence when applying for
47
48
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 placement jobs during the second year. This greater confidence means they perform better during the
4 application process. Finally, our results indicate that completion of a work placement has a
5 significantly positive effect on final year academic performance. This supports hypothesis 3. Our
6 results are consistent with previous studies (SurrIDGE, 2009; Mansfield, 2011; Green, 2011)).
7
8 Therefore, students who complete a work placement gain skills, qualities and attributes which helps
9 their academic study during the final year.
10
11
12
13
14
15
16
17

18 These results have important implications for universities' policies around work placements
19 specifically and experiential learning generally. In general, work placements produce positive
20 academic and employment outcomes for students who complete them. Our results suggest several
21 areas where universities could do more to raise participation rates.
22
23
24
25
26
27

28 Firstly, universities could provide better information at enrolment about the positive employment and
29 academic outcomes associated with the completion of one. This may encourage more students to
30 determine the investment is worthwhile and enrol on sandwich degrees. However, at the same time,
31 universities will need to be aware that many students may be still reticent to pursue work placement
32 opportunities because they lack self-confidence. Targeted programmes around self-confidence may
33 encourage some of these students to consider work placements.
34
35
36
37
38
39
40
41

42 Secondly, if more students can be encouraged onto a sandwich route, our findings imply that
43 appropriate messaging during the first year could highlight the importance of academic performance
44 in that year to the probability of successfully securing a work placement. Since, in many institutions,
45 average first year marks are not used when determining final degree classification, this information
46 could provide the motivation for students to devote greater effort to studies in that year. This may
47 raise average academic performance. Further, integrating this messaging with the programme of
48 support for students with low academic self-concept may induce better academic performance and
49
50
51
52
53
54
55
56
57
58
59
60

1
2
3 raise their self-confidence. This should increase the percentage of students securing year-long
4 placement positions.
5
6

7
8 In addition, during the second year, universities could target their support during the application
9 process. For instance, self-concept theory suggests that students who achieved lower first-year grades
10 will have lower self-confidence. Such students could be given exclusive formal support through
11 workshops which may help (i) identify the positions they are more likely to obtain, (ii) successfully
12 negotiate the application process and (iii) make earlier and greater numbers of applications.
13
14
15
16
17
18

19
20 However, it must be accepted that there will always be students who are unwilling / unable to make
21 the commitment involved in an extra year of study for financial or other personal reasons. Further, in
22 a competitive market for placements, there will be students who do not gain a work placement.
23 Therefore, alternatives to year-long work placements may be required to provide these students with
24 experiential learning opportunities (Bates and Gamble, 2011). This includes short internships,
25 consultancy projects or work-like experiences. Part of the difficulty with these approaches is
26 identifying what sort of activities completed in these alternatives will replicate the skills, qualities
27 and attributes which students gain during an extended work placement. However, attempts at doing
28 so will also help address the widening participation agenda by improving the academic and
29 employment outcomes for all students.

47 **Conclusion**

48
49 This paper analyses the influence of academic performance on decisions around work placements
50 using a sample of 226 students who successfully completed economics and business courses at a UK
51 University between 2015 and 2019. We distinguish between groups of students through their
52 intentions regarding the completion of a work placement on entry as well as whether they completed
53 one by the end of their degree. This enables our work to add to the literature in several ways. Firstly,
54
55
56
57
58
59
60

1
2
3 we assess the role of academic self-concept through prior academic performance on the investment
4 decision regarding whether to include a work placement in a degree. Secondly, we assess the
5 significance of academic self-concept through academic performance on success in securing a work
6 placement. Finally, after accounting for prior academic performance, we analyse the impact of work
7 placements on final year academic performance.
8
9
10
11
12
13
14

15 We find that academic performance did have a significant impact on students' decisions to include a
16 year-long work placement in their programme of study. This indicates that students with greater
17 academic self-concept are more confident about their ability to secure work placements. Additional
18 research could investigate additional factors which influence self-confidence and their role in the
19 investment decision around degree study. This would help universities provide better guidance and
20 support for students. We find that better first-year academic performance had a significantly positive
21 influence on the likelihood of gaining a placement job. Again, this is consistent with self-concept
22 theory. Better performance improves students' self-confidence which improves their likelihood of
23 securing a work placement. Information about the importance of first-year academic performance
24 needs to be communicated to students. Further, during the second year, support provided by
25 universities during the application process may need to be targeted to those with lower first-year
26 grades. Additional research in this area could investigate how the signals and support given by
27 universities around placements influences students' expectations and how the impact of failure to
28 gain a work placement affects self-confidence, and hence, motivation and effort levels during the
29 final year of study.
30
31
32
33
34
35
36
37
38
39
40
41
42
43
44
45
46
47
48
49

50 Finally, our results show that the completion of a work placement makes a significant contribution
51 to academic performance in the final year. This work adds to the growing literature that the
52 completion of a work placement develops skills, qualities and attributes which are beneficial in final
53 year study. However, as our study shows, there are groups of students who are unwilling or unable
54 to complete a structured work placement. Therefore, course designers, while offering the opportunity
55
56
57
58
59
60

1
2
3 for a structured work placement may need to provide alternative ways of imbuing the skills, qualities
4 and attributes gained in a work placement to students who do not complete one. By doing so,
5 universities will improve academic performance across all student groups while also developing more
6 employable graduates.

Figure 1. Study schematic

H1: Students with higher academic performance are more likely to choose to complete work placements.

Dependent variable: UCAS points
 Treatment: Route selected at entry (SW vs FT)
 Covariates: Table 1 excluding residency first year, second year and final year grade)

H2: Students with higher academic performance are more likely to successfully secure work placements.

Dependent variable: First year grade
 Treatment: Study Route (SW-SW vs SW-FT)
 Covariates: Table 1 (excluding UCAS points, second and final year grade)

H3: Completion of a work placement has a positive influence on final year academic performance.

Dependent variable: Final year grade
 Treatment: Study Route (SW-SW, FT-SW, FT-FT)
 Covariates: Table 1 (excluding UCAS points)

Higher Education, Skills and Work-Based Learning

Table 1. Descriptive analyses of the data set.

Variable	Total Count	Mean	Standard Deviation
UCAS points (mean)	217	306.13	62.10
First year mark (mean)	226	59.84	8.44
Second year mark (mean)	226	61.42	8.04
Final year mark (mean)	226	63.90	8.53

	Total Count	Percentage
Age at entry	226	97% 18-20, 3% 21-25
Gender	226	76% Male, 24% Female
Ethnicity	226	75% White, 25% Ethnic Minority
Residency	226	96% Home, 4% Overseas
Widening participation	226	87% No, 13% Yes
Entry qualification	226	71% A-levels, 29% Others/mix

Table 2. Number and percentage of students on the three routes.

Route	Count	Percent
FT-FT	73	32.30
SW-FT	75	33.19
SW-SW	78	34.51
N=	226	

Key

FT-FT: Students who indicated they did not want to do a work placement at enrolment and did not.

SW-FT: Students who indicated they wanted to do a work placement at enrolment but did not secure one.

SW-SW: Students who indicated they wanted to do a work placement at enrolment and completed one.

Table 3. Hypothesis 1: Multiple linear regression analysis weighted by propensity scores

Variable	Coefficient	Standard Error	p-value	95% Confidence Interval
(Intercept)	326.0	12.4	<0.01	(301.0, 350.0)
Route (SW, reference FT)	22.9	10.2	<0.05	(2.95, 42.9)
Gender	15.1	16.9	0.37	(-18.0, 48.1)
Age	0.16	22.8	0.99	(-44.6, 44.9)
Ethnic origin	2.20	9.6	0.82	(-16.6, 21.0)
Widening participation	4.90	11.0	0.66	(-66.6, 26.4)
Entry qualification type	-55.2	12.1	<0.01	(-78.8, -31.5)
n= 217				

Table 4. Hypothesis 2: Multiple linear regression analysis weighted by propensity scores

Variable	Coefficient	Standard Error	p-value	95% Confidence Interval
(Intercept)	58.14	1.62	<0.01	(54.93, 61.34)
Route (SW-SW, reference SW-FT)	2.85	1.29	<0.05	(0.30, 5.39)
Gender	2.71	1.47	0.06	(-0.18, 5.61)
Age	-7.00	10.30	0.46	(-27.40, 13.30)
Ethnic origin	-2.81	1.79	0.12	(-6.34, 0.72)
Widening participation	-1.48	2.18	0.50	(-5.79, 2.82)
Entry qualification type	2.15	1.60	0.18	(-5.34, 17.17)
Residency	5.92	5.70	0.30	(-3.18, 15.00)
n= 226				

Table 5. Hypothesis 3: Multiple linear regression analysis weighted by propensity scores

Variable	Coefficient	Standard Error	p-value	95% Confidence Interval
(Intercept)	24.48	3.70	<0.01	(17.20, 31.77)
Route (SW-SW, reference FT-FT)	4.60	1.06	<0.01	(2.51, 6.68)
Route (SW-SW, reference SW-FT)	3.38	1.09	<0.01	(1.25, 5.51)
Route (SW-FT, reference FT-FT)	1.08	0.99	0.28	(-0.86, 3.02)
First year grade	0.24	0.07	<0.01	(0.09, 0.39)
Second year grade	0.38	0.08	<0.01	(0.22, 0.54)
Gender	3.66	0.99	<0.01	(1.70, 5.61)
Age	0.88	3.18	0.78	(-5.39, 7.15)
Ethnic origin	0.19	1.09	0.86	(-1.96, 2.34)
Widening participation	-1.40	1.27	0.27	(-3.91, 1.11)
Entry qualification type	-1.25	0.98	0.20	(-3.19, 0.69)
Residency	3.58	2.70	0.19	(-8.89, 1.73)
n= 226				

Table 6. Maximum standardized effect size, maximum KS statistic and minimum KS p-value for each covariate before weighting.

Coivariate	Maximum standardized effect size	Maximum KS	Minimum KS p-value
Gender	0.237	0.102	0.785
First year grade	0.669	0.330	<0.01
Second year grade	0.662	0.309	0.001
Age	0.425	0.068	0.986
Ethnicity	0.620	0.268	0.007
Residency	0.354	0.069	0.985
Widening participation	0.182	0.062	0.996
Entry qualifications	0.653	0.296	0.002

Table 7. Maximum standardized effect size, maximum KS statistic and minimum KS p-value for each covariate after weighting.

Covariate	Maximum standardized effect size	Maximum KS	Minimum KS p-value
Gender	0.133	0.057	1.000
First year grade	0.201	0.141	0.546
Second year grade	0.200	0.107	0.844
Age	0.261	0.042	1.000
Ethnicity	0.269	0.116	0.749
Residency	0.208	0.041	1.000
Widening participation	0.075	0.026	1.000
Entry qualifications	0.307	0.139	0.556
